Incoming Future: AI from beside to inside for medical purpose

We are migrating from digital health, digital medicine to digital therapeutic. On this migration pathway, we can see Biotechnology, pharmaceutical and medical will work together to solve the unsolved medical problems. And bioinformatical is behind all the places from discovery, engineering to clinical with AI behind and inside. From these days, AI is not only the tools to solve single point of interest or problems, but also is the copilot into your procedure, design, experiment and validation, and retarget your purpose in the complex biological/cell environment. How does AI play a role in? What does AI play a role in? AI future coming in from aside to inside, from simulation to deployment.
